

CRIONED Cryochamber | Whole Body Cryotherapy

The Criomed Cryochamber is a single-person chamber used for individual sessions of Whole Body Cryotherapy. During a session, clients wear minimal protective clothing (gloves, socks, and briefs). The temperature is regulated by the automated system but can also be adjusted within a range of -166°F to -320°F by the operating technician via keypad or optional touchscreen control panel. The recommended session temperature is -240°F for 2-3 minutes.

The unit is equipped with an electric lift used to adjust a client's height in the chamber so that the body is submerged in the hyper-cooled air up to the neck while the head remains above. This enables the client to be in continuous communication with the technician, which improves the client's overall comfort.

For added safety, the Criomed Cryochamber comes standard with a non-locking pivoting door that can be opened at any time. The unit features a heated ventilating system to minimize moisture residues and to vent out used nitrogen gasiform air. The geometric design of the inner cabin optimizes convection of cryotherapy temperatures for improved session results.

- Temperature Range: -166°F to -320°F
- Continuous Flow Technology for stable temperature throughout the session
- Electric lift with push button control
- Two cabin sizes (Plus and XL) customizable with seven exterior and interior color options (Matte Grey shown)
- Session time: 2-3 min
- Nitrogen usage during session: avg of 6 liters per session
- E-Tablet Control Panel and viewing screen
- Extended Warranty available
